INTRODUCTION:

E-Shaadi is a web/mobile matrimonial platform designed to modernize and accelerate the traditional process of finding Rishta. It digitizes biodata exchange, enables detailed searchable profiles, and provides secure ways for users to discover and communicate with compatible life partners. By centralizing profile data, preference matching, and secure communication, E-Shaadi reduces time and effort, increases transparency, and widens the pool of prospective matches beyond close social circles.

PROBLEMS IT SOLVES:

- Reduces the time-consuming manual search for Rishta.**
- Expands the candidate pool beyond limited family or community networks.**
- Increases transparency with structured profiles (education, profession, future plans, hobbies, etc.).**
- Improves privacy and safety via visibility controls and verification.**

- **Minimizes mismatches by enabling precise filtering and preference settings.**

Target Audience (User Roles):

- **Bride/Groom (Individual User): Create and manage personal profiles, set preferences, search and interact with matches.**
- **Guardian / Family Member: Create/manage profiles on behalf of a family member and view suggested matches.**
- **Admin: Manage users, moderate content, handle verification, view reports/statistics.**
- **Matchmaker (Optional role): Professional matchmakers who can create curated lists, contact potential matches, and manage introductions.**
- **Guest (Unregistered visitor): Limited browsing of public success stories or FAQs (no access to profiles or chat).**

Main Features / Modules (Functionality):

1. Authentication & Authorization:

- Sign up / Login (email, phone)
- OTP / Email verification
- Role-based access (individual, family, admin)

2. Profile Management:

- Create detailed profile fields: name, age, gender, city, religion, caste, complexion, height, education, profession, hobbies, future plans, family details, photos
- Privacy settings (who can view photos, contact info)
- Verification badges (phone, email, ID upload optional)

3. Search & Filters:

- Basic (age, city, religion, education)
- Advanced (height range, caste, hobbies, future plans, migrated/willingness, professional status)
- Save searches and filters

4. Matching Engine:

- Preference-based matching (hard filters + soft-score attributes)
- Suggested matches & daily recommendations
- Mutual-like matching logic (chat unlocked on mutual interest)

5. Communication:

- In-app chat with message history
- Option to reveal contact details after mutual consent
- Report/block users

6. Notifications & Activity Feed:

- Push / Email / In-app notifications for likes, messages, profile views
- Activity log for profile updates and interactions

7. Admin Panel:

- User moderation, content approvals, analytics (active users, matches made)
- Manage feature flags and promotions

8. Payments (Optional):

- Premium subscriptions for enhanced visibility, advanced filters, verified badges

9. Analytics & Success Stories:

- Track matches, signups, conversions; display testimonials

Tools / Technologies Requirements

Since this project is documentation and design-focused (no real implementation required), the following tools will primarily be used for analysis, modeling, and design:

- **Documentation & Diagrams:** Microsoft Word, PowerPoint, Draw.io, Lucidchart, StarUML, Mermaid (for UML diagrams).
- **Project Management:** Notion, or MS Teams for team coordination.
- **Design Prototyping (Optional):** Figma, Adobe XD, or Canva (for interface mockups).

If the project were to move forward into actual development, the following technology stack would be suitable:

- Frontend (Web & Mobile): React Native (for mobile), React.js (for web).
- Backend: Node.js with Express.js.
- Database: MongoDB or PostgreSQL.
- Authentication & Security: Firebase Authentication / JWT.
- Hosting & Deployment: AWS / Firebase / Heroku.

(Note: The current scope is limited to software design documentation; these stacks are proposed only as future continuation.)

Creative Additions (New Features):

To showcase creativity and innovation, the following unique features can be proposed:

1. AI-Powered Compatibility Scoring

- Use machine learning to analyze profile attributes, preferences, and communication style to generate a “compatibility percentage” between two users.

2. Virtual Meeting Rooms

- Integrated video/voice call feature within the platform where families can set up secure, timed virtual meetings before sharing personal contact details.

3. Cultural & Religious Event Matching

- Feature that allows users to search or connect based on shared traditions, events, or community gatherings, helping strengthen compatibility beyond basic biodata.

4. Guardian Dashboard

- A special module for parents/guardians to manage multiple profiles (e.g., siblings), with status tracking for proposals sent/received.

5. Data Analytics for Users

- Provide insights to users such as: *“Your profile is most viewed by people in Karachi”* or *“Your education is the top interest factor in matches.”*

6. Gamified Experience

- Introduce badges (e.g., “Verified”, “Most Viewed Profile”, “Early Bird”) to make the platform engaging and encourage safe participation.
